(54) MEASUREMENT OF ENZYME ACTIVITY

(57)Abstract:

PROBLEM TO BE SOLVED: To simply determine an enzyme activity with high sensitivity by using polypeptide as a substrate, a linking a fluorescent pigment to the substrate, separating the reaction solution through a fluorescence-detecting isoelectric focusing method, then detecting the fluorescent light.

SOLUTION: In the measurement of activity of an enzyme such as protease using a polypeptide as a substrate, this substrate is trypsin or chymotrypsin and bonded through a binding group to a pigment bearing a fluorescent group, for example, rhodamine, fluoresceine, cyanine, indocyanine, indocarbocyanine, pyronine, lucifer yellow, quinacrine, squaric acid, coumarin, fluoroanthrenilmaleimide, anthracene and the like. The substrate is added to a buffer solution containing an enzyme sample, then an enzyme inhibitor is added to stop the reaction and the reaction product is separated through a fluorescence-detecting isoelectric focusing method. The separated fluorescent substance is excited to detect the fluorescent emission whereby the objective enzyme activity is determined in high sensitivity and accuracy.

LEGAL STATUS

[Date of request for examination] 01.06.1999

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number] 3207120

[Date of registration] 06.07.2001

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]
